

# System Architecture & Technical Specifications

Real Estate CRM & Outbound AI WhatsApp Agent Platform

---

**Prepared For:** Internal Review & Product Strategy

**Date:** June 2026

**System Version:** 3.0 (Production Ready)

**Stack Coverage:** React (SPA), Node.js (Prisma), Python (LangGraph, pgvector), Twilio

# 1. System Overview

The application is a state-of-the-art, multi-tenant Real Estate CRM integrated with an autonomous, WhatsApp-enabled conversational AI agent. The stack is split into three decoupled services to ensure scaling independence and isolation of concerns:

- **Frontend (React + Vite + Tailwind):** A dashboard environment allowing real estate brokers to upload brochures, register leads, launch campaigns, and monitor live chat.
- **Backend Service (Node.js + Express + Prisma):** Serves as the primary CRM service. Manages authentication, database schemas, Twilio webhooks, and campaign schedules.
- **AI Agent Service (Python + FastAPI + LangGraph):** Stateful Agent loop using LangGraph that searches matching projects via PostgreSQL pgvector cosine similarity, processes criteria, and books site visits.

# 2. Technology Stack Breakdown

| Layer         | Technology            | Primary Functionality                                                    |
|---------------|-----------------------|--------------------------------------------------------------------------|
| Frontend      | React (Vite)          | SPA providing real-time dashboards, campaigns logs, and chat controls.   |
| Styling       | Tailwind CSS          | Sleek, modern user interface, layouts, and components.                   |
| Backend API   | Node.js (Express)     | REST API host, database controllers, campaign runner schedules.          |
| ORM           | Prisma ORM            | Manages PostgreSQL database schemas, transactions, and seed scripts.     |
| AI Service    | FastAPI (Python)      | High-performance asynchronous API wrapping the agent execution loop.     |
| Agent Logic   | LangGraph / LangChain | Stateful multi-agent graph architecture with memory checkpointer.        |
| Vector Search | pgvector (Postgres)   | Stores, indexes, and retrieves document embedding chunks.                |
| Media CDN     | Cloudinary SDK        | Asset uploads (brochures, photos) mirrored directly to global CDN links. |

# 3. Complete API Endpoint Catalog

The API ecosystem spans the CRM backend service and the internal AI engine service.

A. CRM Backend Service Routes (/api)

| Endpoint                         | Method  | Scope & Description                                          |
|----------------------------------|---------|--------------------------------------------------------------|
| /auth/register                   | POST    | Create a new business profile. Rate-limited.                 |
| /auth/login                      | POST    | Login, return JWT token. Rate-limited.                       |
| /auth/refresh                    | POST    | Refresh JWT access token using a refresh token.              |
| /auth/me                         | GET     | Fetch profile data for currently logged-in account.          |
| /auth/me                         | PUT     | Update profile details (availability, business info).        |
| /leads/upload                    | POST    | Multipart upload of Excel/CSV leads to campaign.             |
| /leads                           | GET     | List active leads (paginated, with sorting).                 |
| /leads/:id                       | GET     | Fetch detailed lead profile by ID.                           |
| /leads/:id/status                | PUT     | Update lead stage (pending, nurturing, hot, etc).            |
| /campaigns                       | POST    | Create a new outreach campaign draft.                        |
| /campaigns                       | GET     | List campaigns for the business.                             |
| /campaigns/:id                   | GET/PUT | Retrieve or update campaign settings.                        |
| /campaigns/:id/launch            | POST    | Trigger opener template send to all leads.                   |
| /campaigns/:id/pause             | POST    | Pause campaign outreach worker.                              |
| /campaigns/:id                   | DELETE  | Delete campaign record.                                      |
| /kb/create                       | POST    | Create a new KB Vector collection.                           |
| /kb                              | GET     | List business KB collections.                                |
| /kb/:id/upload                   | POST    | Multipart brochure upload. Mirrors to Cloudinary + pgvector. |
| /kb/:id/url                      | POST    | Scrape a website URL and embed its text content.             |
| /kb/:id/documents                | GET     | List source files and chunk metadata.                        |
| /kb/:id/document/:docId          | DELETE  | Purge document chunks from vector DB.                        |
| /booking/slots                   | GET     | Fetch available booking slots for a target date.             |
| /booking/book                    | POST    | Book an appointment (manual or agent-driven).                |
| /booking/appointments            | GET     | Retrieve scheduled site visits.                              |
| /booking/availability            | GET/PUT | Read or update business work hours.                          |
| /booking/appointments/:id/status | PUT     | Set status (confirmed, cancelled, completed).                |
| /conversations                   | GET     | List active chat rooms (paginated).                          |
| /conversations/:id/messages      | GET     | Fetch message logs for a specific room.                      |
| /conversations/:id/takeover      | POST    | Assign control to human agent (stops AI replies).            |

|                                  |      |                                                             |
|----------------------------------|------|-------------------------------------------------------------|
| /conversations/:id/release       | POST | Release back to autonomous AI agent replies.                |
| /conversations/:id/human-message | POST | Deliver manual text to WhatsApp via Twilio.                 |
| /analytics/overview              | GET  | Fetch overview stats (message counters, rates).             |
| /analytics/campaign/:id          | GET  | Fetch counters for a target campaign.                       |
| /analytics/activity              | GET  | Fetch activity logs.                                        |
| /content/generate                | POST | Call AI service to generate marketing copy (SMS/Email/etc). |
| /events                          | GET  | SSE endpoint. Feeds live-chat activity to React UI.         |
| /webhook/whatsapp/incoming       | POST | Twilio webhook; catches user reply & calls AI agent.        |
| /webhook/whatsapp/status         | POST | Twilio webhook; records message status changes.             |

B. AI Service Internal Routes (Port 8000)

Used internally by backend nodes to query conversational steps or generate content templates.

| Endpoint                       | Method | Input Payload / Return Description                                                                                              |
|--------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------|
| /agent/message                 | POST   | Payload: {thread_id, message, kb_id, campaign_config}<br>Return: {reply, qualification_score, stage, needs_human, brochure_url} |
| /kb/{kb_id}/file               | POST   | Payload: File + Description. Returns Cloudinary URL & chunk count.                                                              |
| /kb/{kb_id}/documents          | GET    | List source filenames and page content details.                                                                                 |
| /kb/{kb_id}/documents/{source} | DELETE | Delete document chunks from PostgreSQL pgvector.                                                                                |
| /content/generate              | POST   | Payload: {type, brief, tone}. Generates marketing copies.                                                                       |
| /health                        | GET    | Simple ping route returning {status: 'ok'}.                                                                                     |

4. Server-Sent Events (SSE) Architecture

Real-time event synchronization is crucial to let agents take over conversations instantly. We choose **Server-Sent Events (SSE)** over WebSockets to maintain a lightweight, native, unidirectional push mechanism (Server to Client) with auto-reconnection out of the box.

How It Operates:

- 1. **Persistent Tunnel:** React requests `GET /api/events` with JWT credentials. Express responds with `Content-Type: text/event-stream` and keeps the socket alive.
- 2. **Tenant Mapping:** The backend `sseService` groups open response sockets by `businessId`. When a webhook receives a user message or sends an agent reply, it loops through the associated client sockets

and calls `res.write()`.

- 3. **Audio & Toast Chime:** If the pushed message carries a `hot_lead` trigger or a stage set to `handoff`, the React hook (`useSSE.js`) plays a dual-frequency synthesizer chime utilizing the Web Audio API.

## 5. Current Pros, Cons, and Architecture Limits

| Current Strengths (Pros)                                                                                                                                                                                                                                                                                                                                                                            | Architectural Trade-offs / Limits (Cons)                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• <b>Stateful Memory:</b> LangGraph checkpointer persists intent signals across sessions, enabling context-aware responses.</li><li>• <b>Media Delivery:</b> Auto-fallback pushes Cloudinary links directly to the browser, bypassing Twilio's media server.</li><li>• <b>Strict Capping:</b> 900-char text cap protects Twilio text length limits.</li></ul> | <ul style="list-style-type: none"><li>• <b>Synchronous Webhooks:</b> The Node webhook API to FastAPI synchronously calls AI endpoints, blocking the Twilio response path.</li><li>• <b>Sandbox Restrictions:</b> In development, leads must text a join phrase to activate the chatbot.</li><li>• <b>Rate Limits:</b> Twilio's 400 messages per second limit may occasionally be reached under heavy stress testing on Groq/Mistral.</li></ul> |

## 6. Future Roadmap Suggestions

- 1. **Asynchronous Task Worker:** Implement a message queuing layer (e.g. BullMQ & Redis). Node webhook immediately answers Twilio 200 OK, queuing the AI response task asynchronously. This completely mitigates Twilio timeout issues.
- 2. **Production WhatsApp Profile:** Transition to an official WhatsApp Business API profile. This bypasses sandbox constraints, allows native interactive buttons, list options, and removes sandbox opt-in rules.
- 3. **Hybrid Keyword/Semantic Search:** Integrate BM25 search index on pgvector. This allows exact match scoring on specific strings (like flat size, floor numbers, prices) where semantic embeddings are occasionally imprecise.
